Arduino

The name is an Italian masculine name, *meaning* "strong friend"

I hear and I forget. I see and I remember.
I do and I understand.

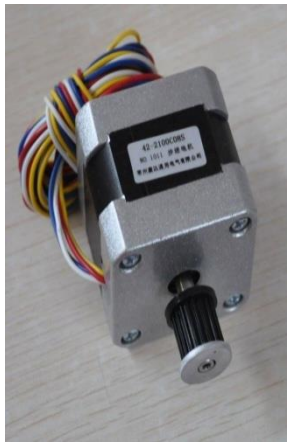
-Confucius

'Reform, Perform And Transform Is Our Mantra'

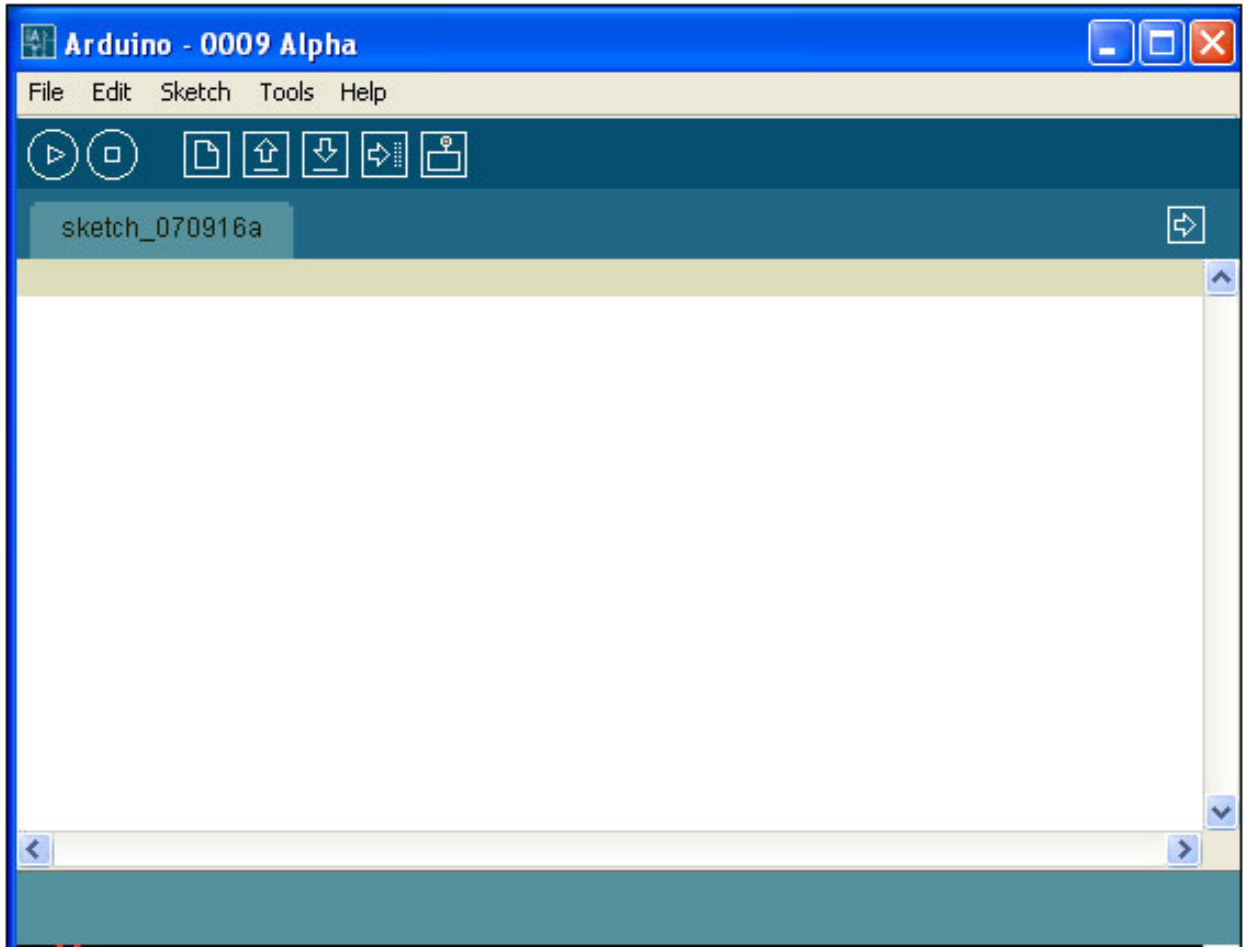
-Shri Narendra Modi

What do we need?

Nodemcu - Periphery



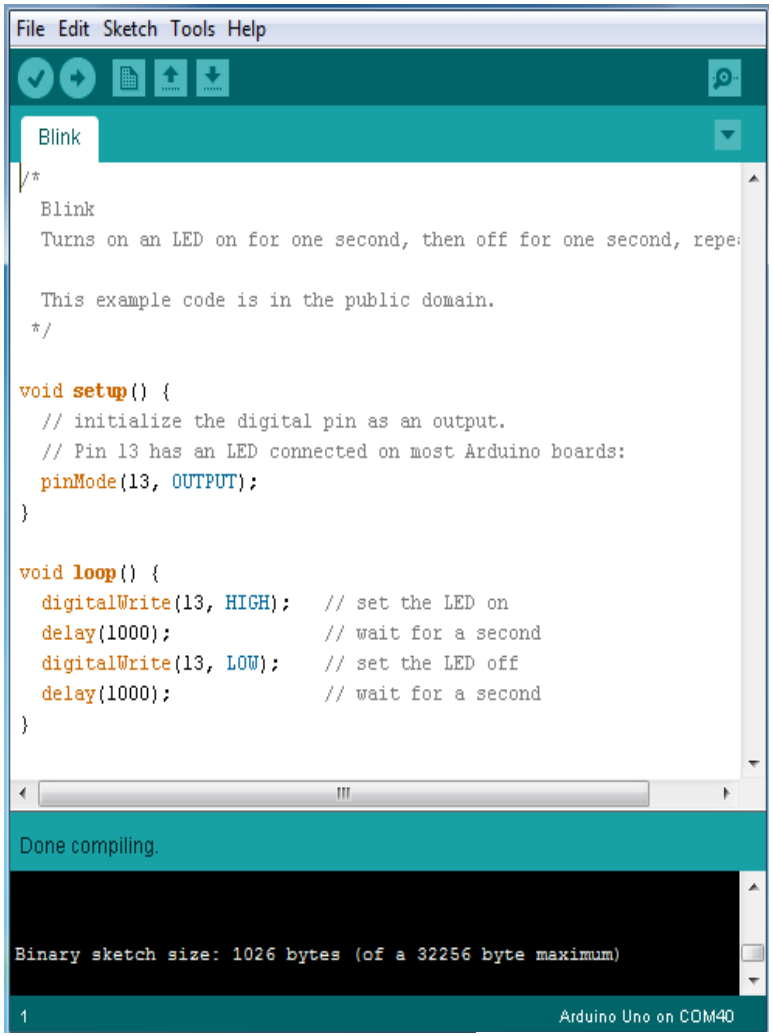
Download and install the Arduino Software



ARDUINO

Programming an Arduino

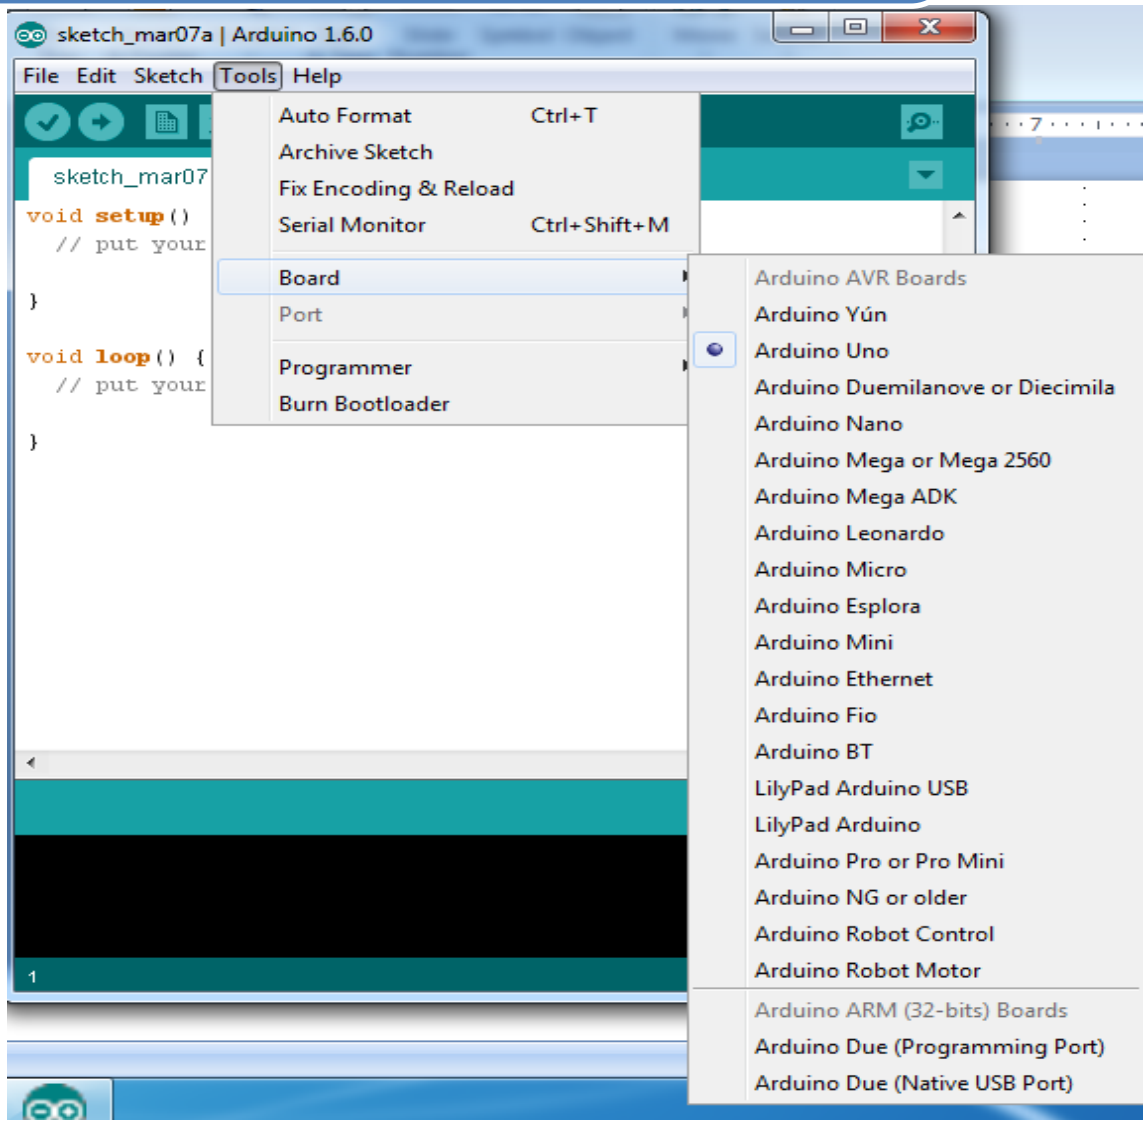
- The Arduino software consists of a development environment (IDE) and the core libraries.
- The IDE is written in Java and based on the processing environment.
- The core libraries are written in C and C++ and compiled using avr-gcc compiler.



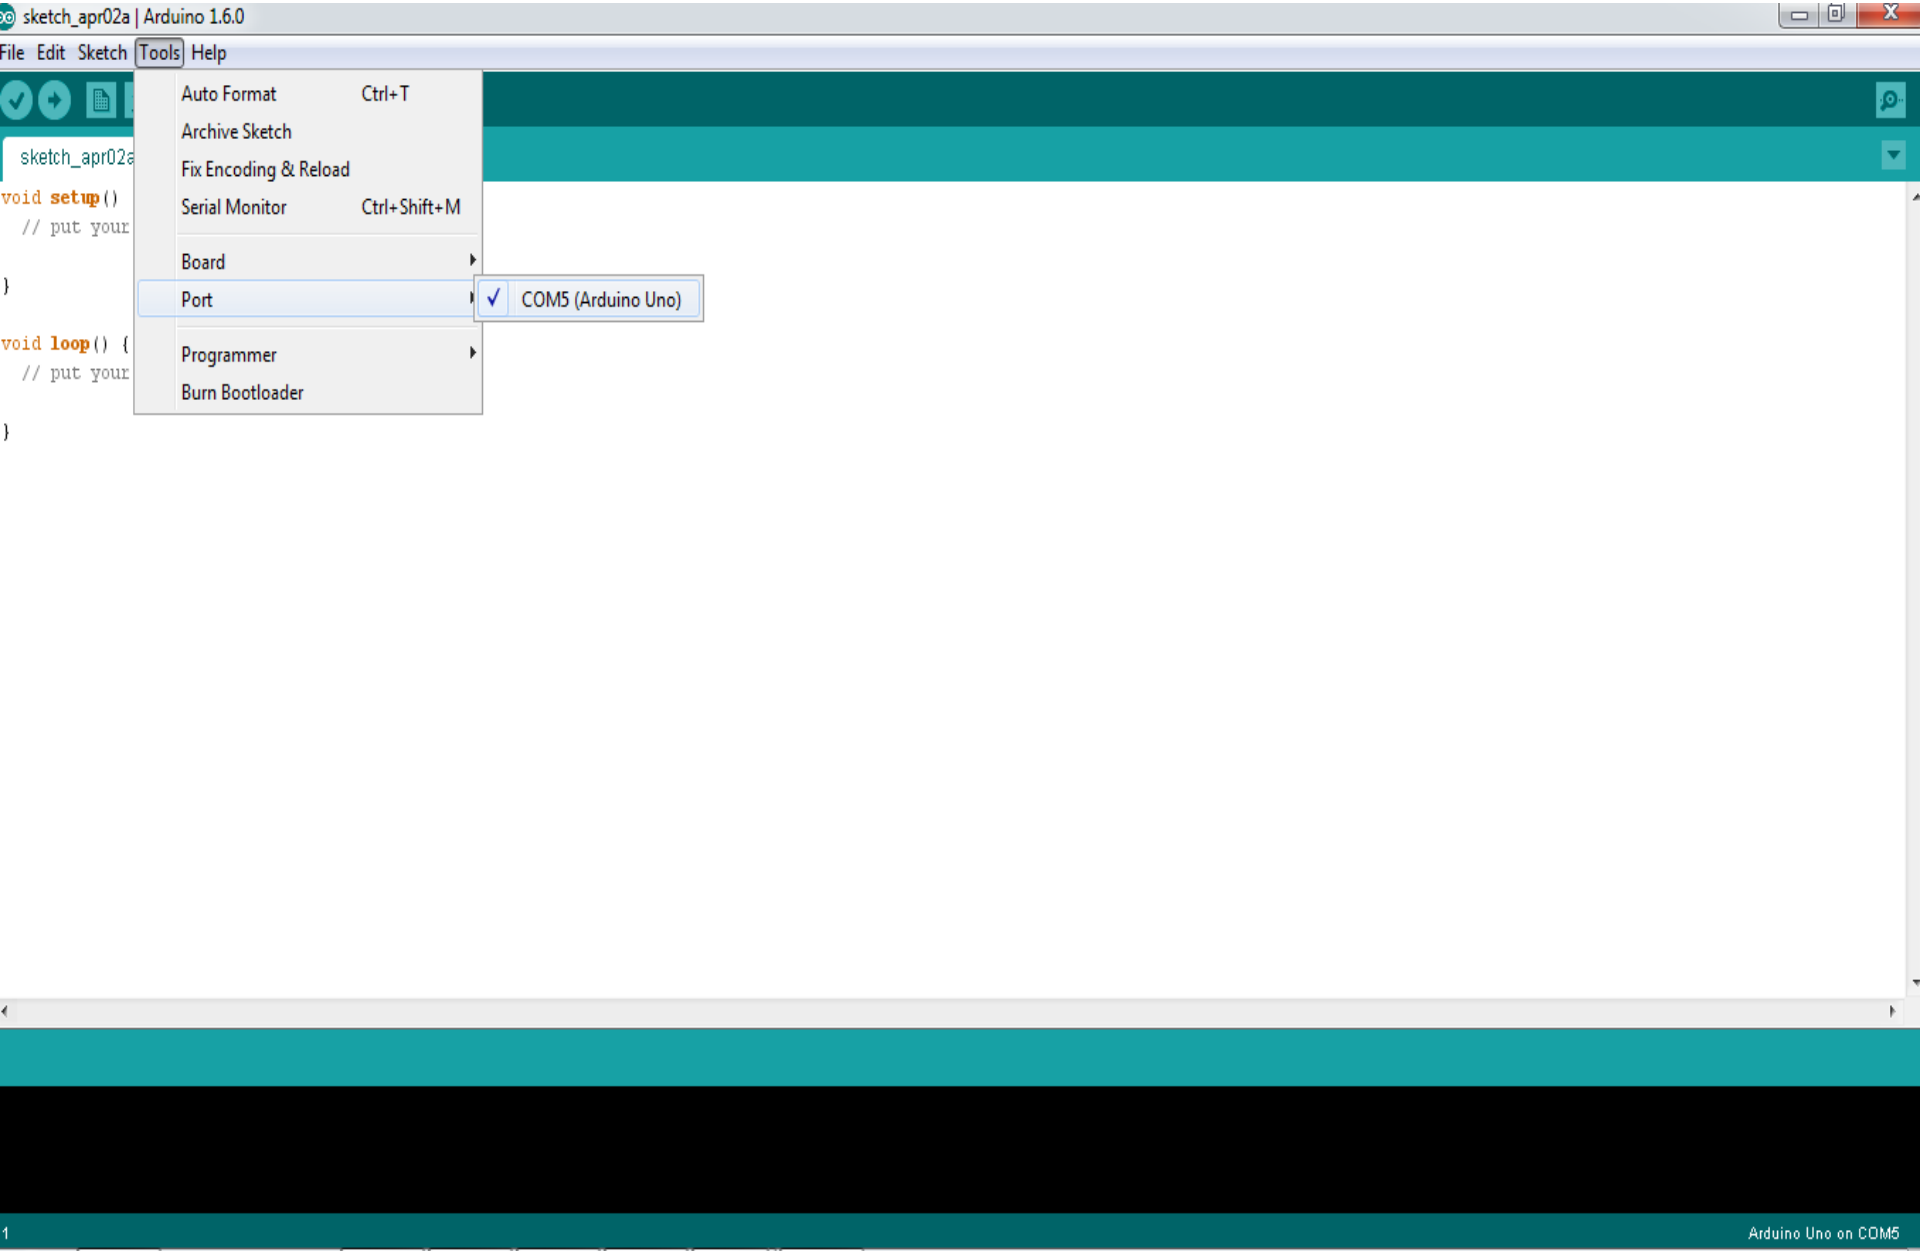
ARDUINO

FIRST PROGRAM ON IDE

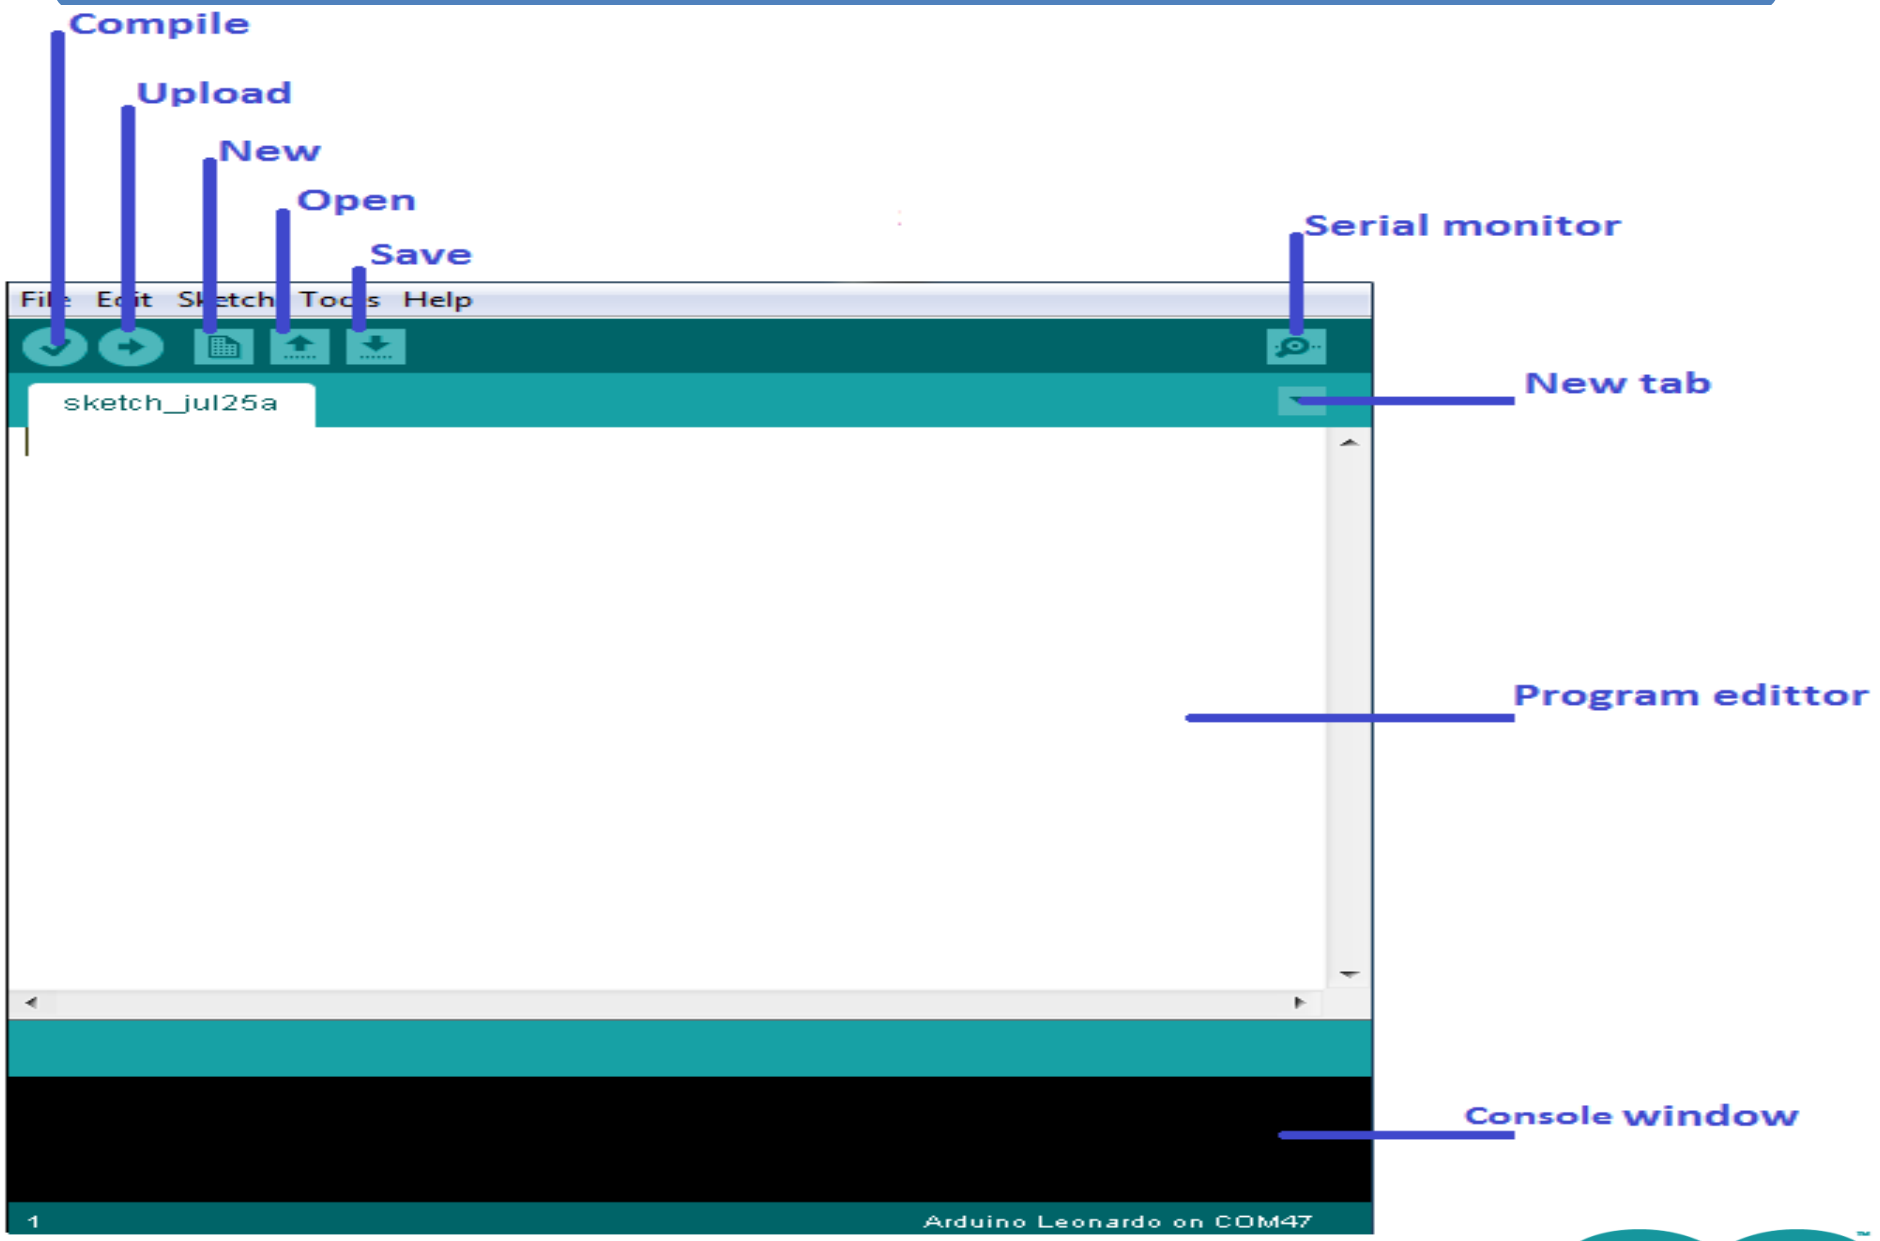
- **Click on arduino (∞) IDE**
- **Tools –Select board**
- **Serial port –COM port**



Configure the Serial Port



Arduino environment



Structure of Arduino Uno code

sketch_mar12a

```
void setup() {
  // put your setup code here, to run once:

}

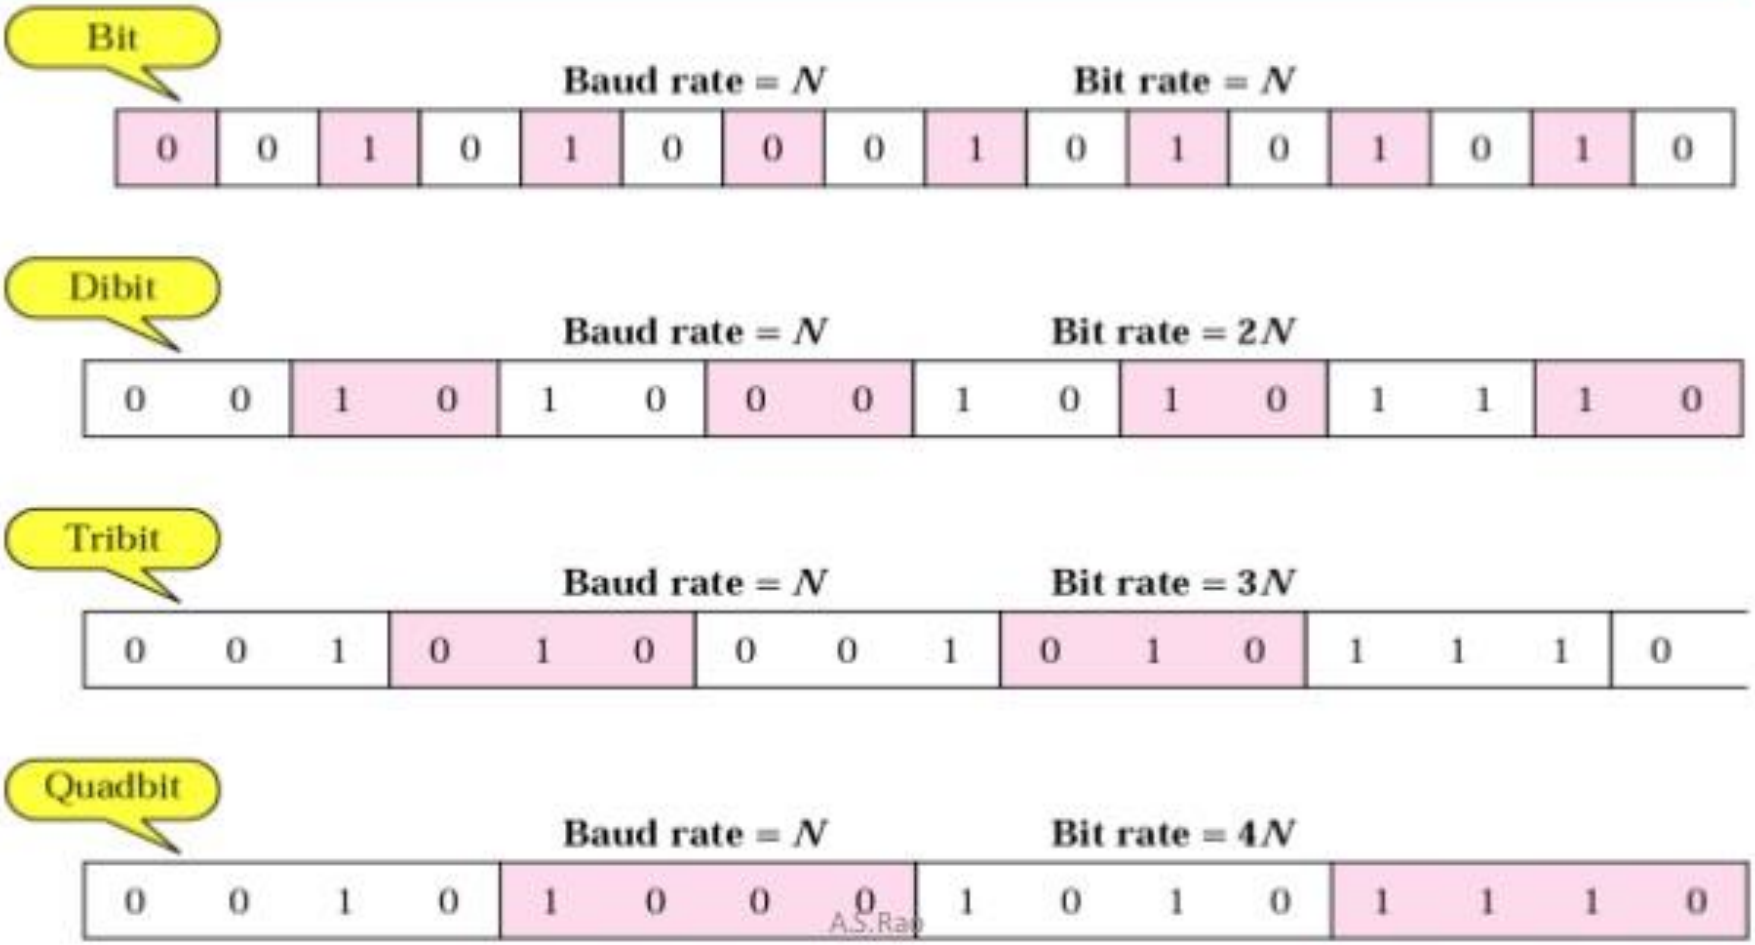
void loop() {
  // put your main code here, to run repeatedly:

}
```

ARDUINO

Bit Rate Vs Baud Rate

Bit rate is the number of bits per second. Baud rate is the number of signal units (symbols) per second. Baud rate is less than or equal to the bit rate.



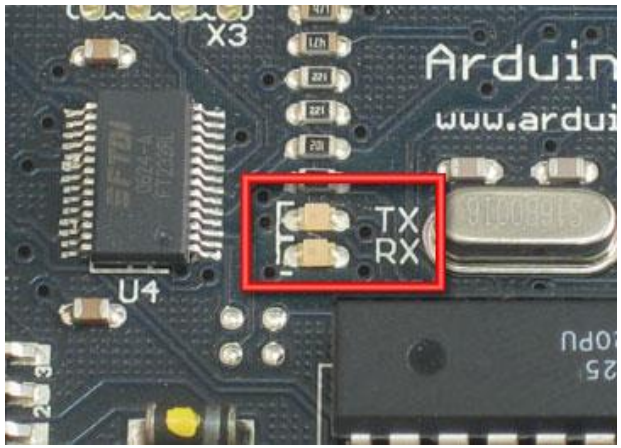
Serial Communications

- "Serial" because data is broken down into bits, each sent one after the other down a single wire.
- The single ASCII character 'B' is sent as:

```
'B' =  0 1 0 0 0 0 1 0
    =  L H L L L L H L
    =
```

- Toggle a pin to send data, just like blinking an LED
- You could implement sending serial data with `digitalWrite()` and `delay()`
- A single data wire needed to send data. One other to receive.

Serial Communication



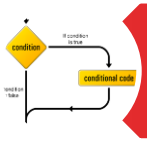
- ***Compiling*** turns your program into binary data (ones and zeros)
- ***Uploading*** sends the bits through USB cable to the Arduino
- The two LEDs near the USB connector blink when data is transmitted
  - **RX** blinks when the Arduino is receiving data
  - **TX** blinks when the Arduino is transmitting data

BIG 6 CONCEPTS

digitalWrite()

analogWrite()

digitalRead()



if() statements / Boolean

analogRead()

Serial communication

Delay()

ARDUINO

pinMode()

Syntax:

pinMode(pin, mode)

Parameters

pin: the number of the pin whose mode you wish to set

mode: INPUT, OUTPUT

commands to know…

- **pinMode**(pin, INPUT/OUTPUT);
- ex: **pinMode**(13, OUTPUT);

- **digitalWrite**(pin, HIGH/LOW);
- ex: digitalWrite(13, HIGH);

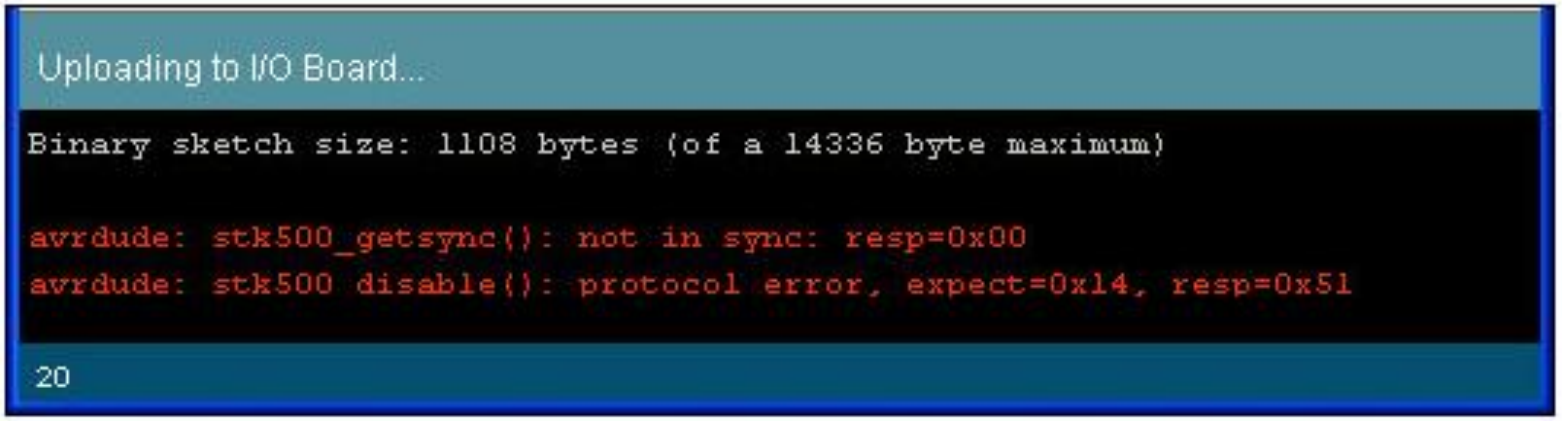
- **delay**(time_ms);
- ex: delay(2500); // delay of 2.5 sec.

- **// NOTE: -> commands are CASE-sensitive**

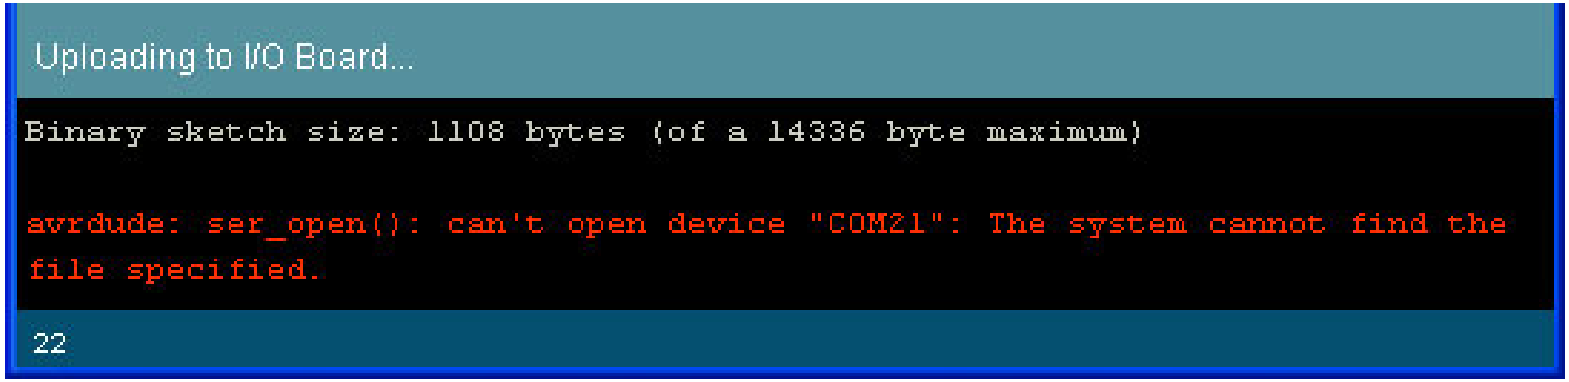
ARDUINO

Error

- avrdude: stk500_getsync(): not in sync: resp=0x00



- can't open device "COM10": The system cannot find the file specified



BREAD BOARD

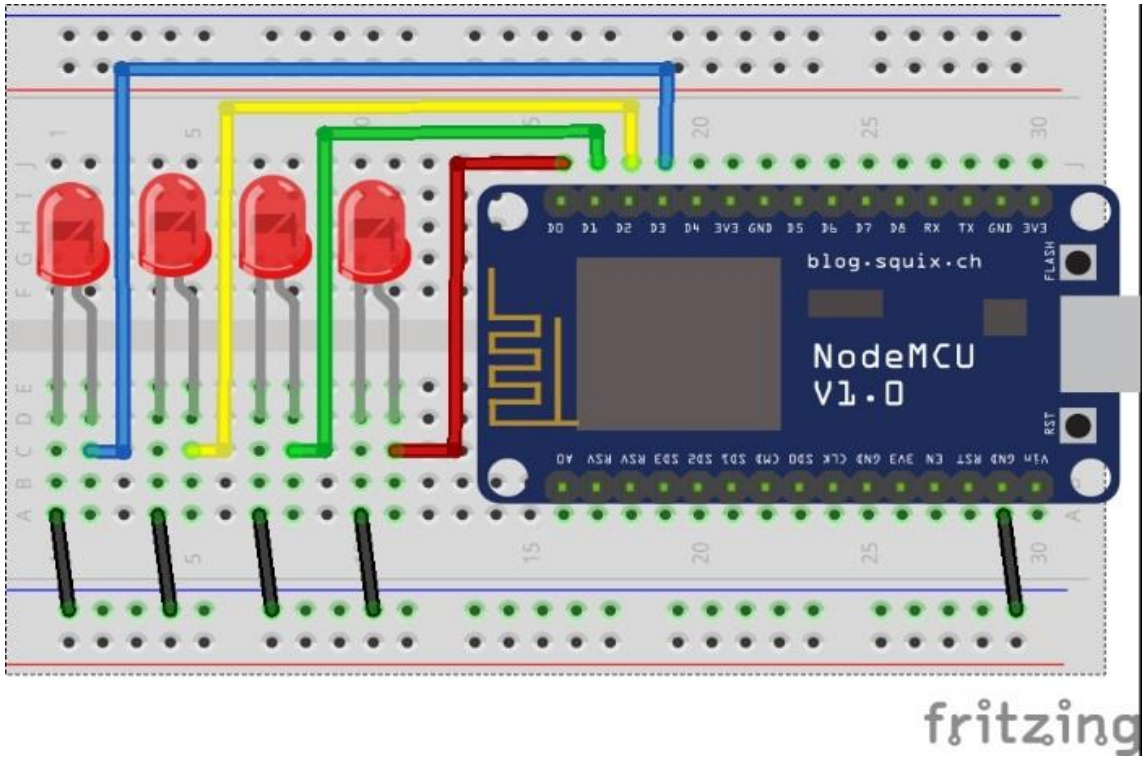
LED Pattern

LED Pattern using NodeMcu



analogRead()(pin:A0)

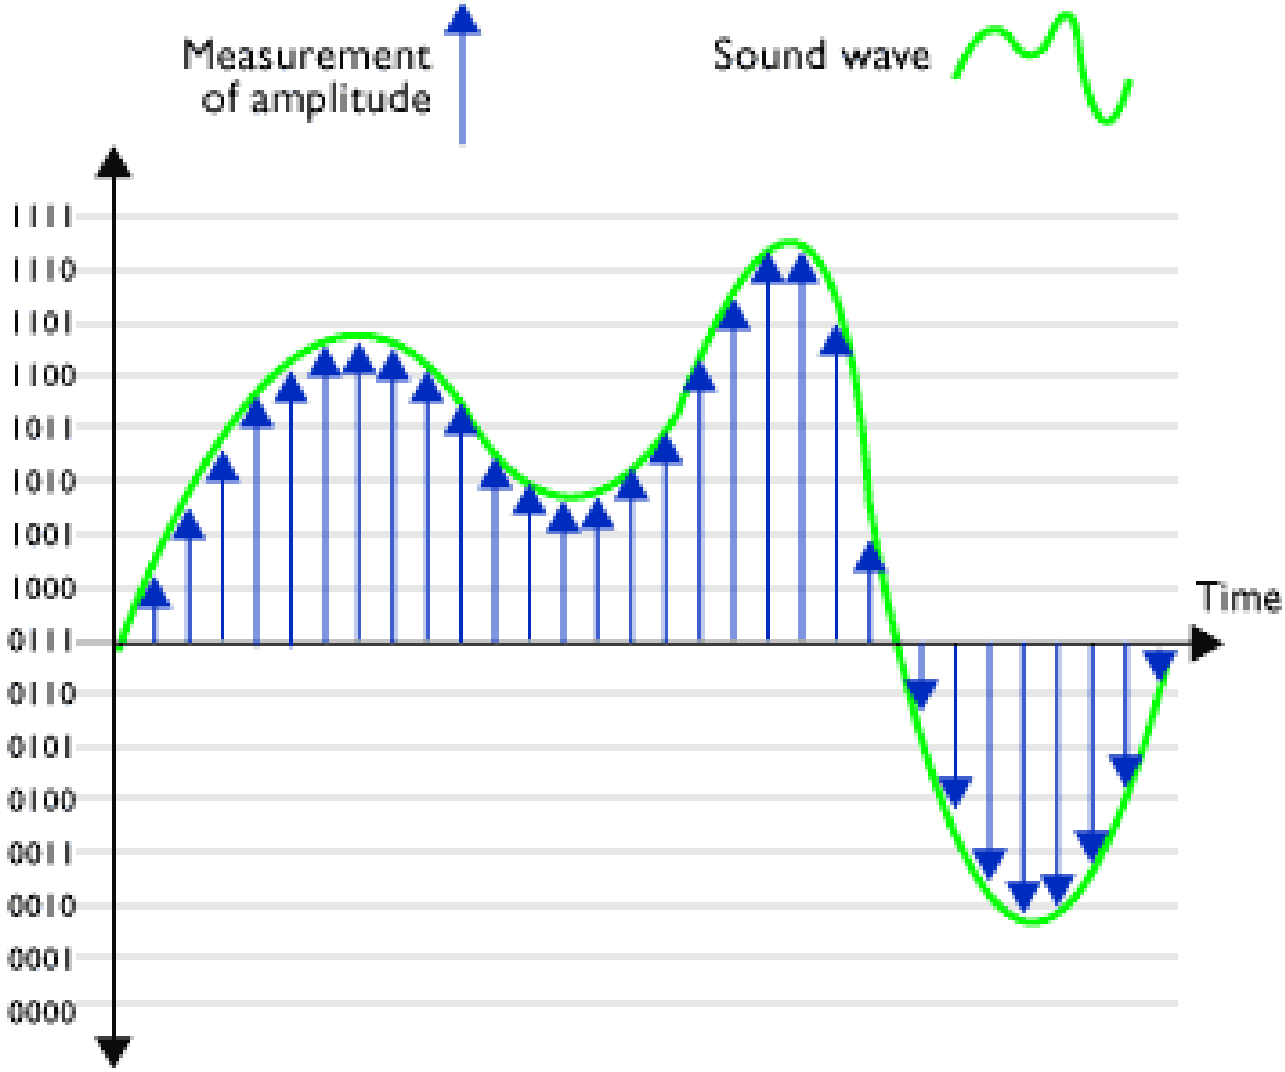
- Reads the value from the specified analog pin. The Nodemcu board contains a 6 channel.
- 10-bit ADC. This means that it will map input voltages between 0 and 5 volts into integer values between 0 and 1023.

$$\frac{1023}{5} = \frac{ADC\ Reading}{Analog\ Voltage\ Measured}$$

- It takes about 100 microseconds to read an analog input

- **Syntax**
- **analogRead(pin)**
- **pin: the number of the analog input pin to read from (A0)**

- Resolution of ADC..?
- Effect of resolution



Each measurement is assigned a number (byte) according to its amplitude. The end result is a file comprising a string of bytes, eg ...
1001 1110 0001 1010 0111 0100 1111 1101 etc

digitalRead() (pin 0-13)

- **Description**
- **Reads the value from a specified digital pin, either HIGH or LOW.**

Syntax

digitalRead(pin)

pin: the number of the digital pin you want to read (*int*)

Returns

HIGH or LOW

ARDUINO

```
int analogPin = 3;connected to analog pin 3
          // outside leads to ground and +5V
int val = 0;                  // variable to store
the value read

void setup()
{
  Serial.begin(9600);              //  setup
serial
}

void loop()
{
  val = analogRead(analogPin);     // read
the input pin
  Serial.println(val);               // debug
value
}
```

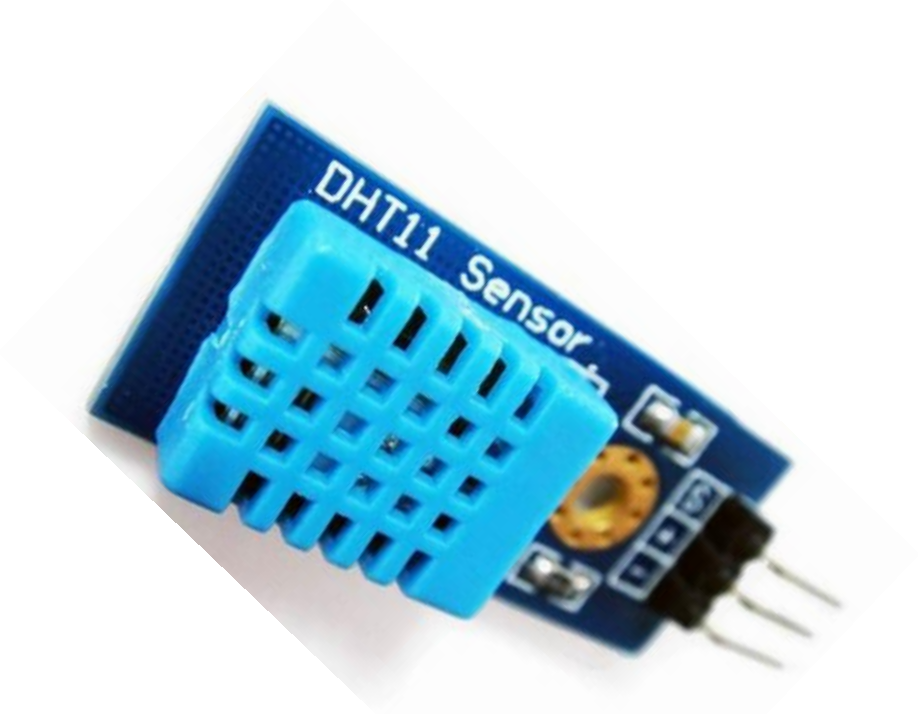
DHT Sensor With NodeMcu

DHT11 Temperature and Humidity Sensor

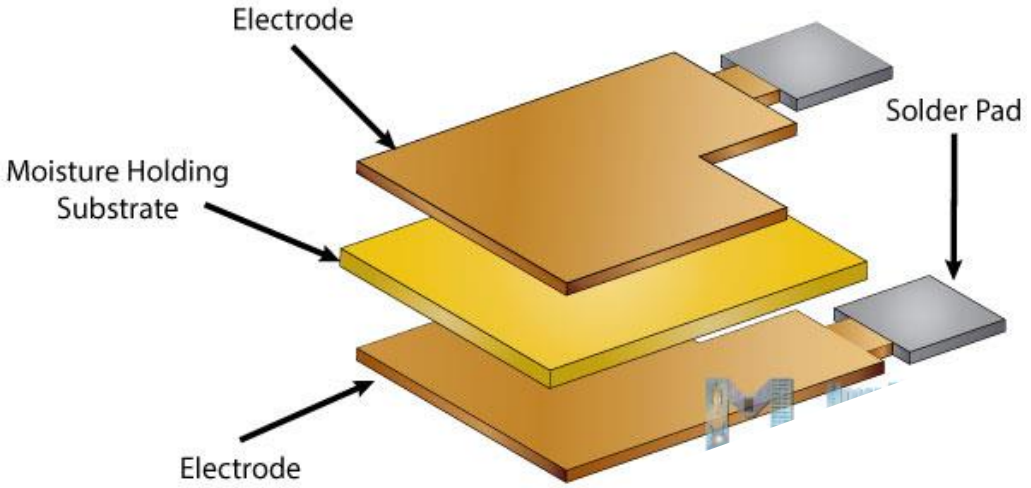
- **DHT11 is a basic, ultra low-cost digital temperature and humidity sensor**
- **Capacitive humidity sensor and a thermistor to measure the surrounding air**
- **Detects water vapor by measuring the electrical resistance between two electrodes**
- **Humidity sensing component is a moisture holding substrate with electrodes applied to the surface**

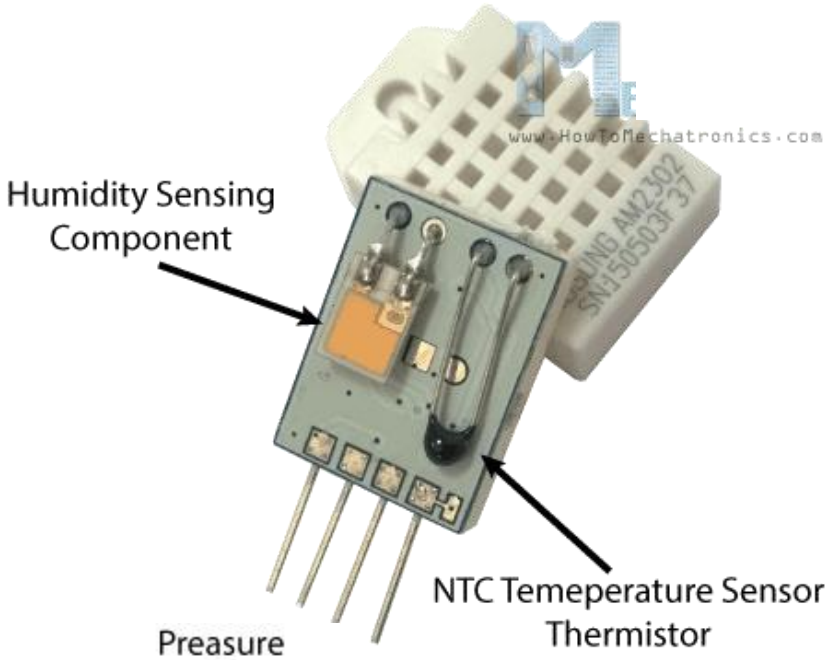
Technical Specification:

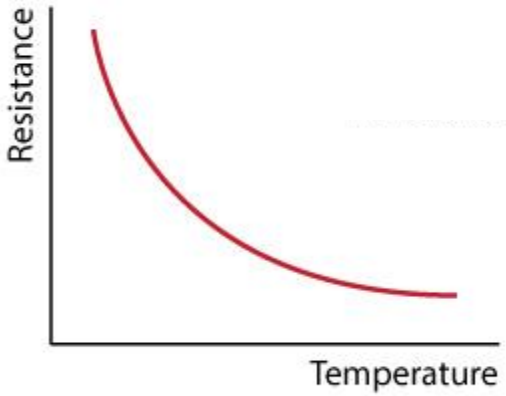
- Humidity Range: 20-90% RH
- Humidity Accuracy: ±5% RH
- Temperature Range: 0-50 °C
- Temperature Accuracy: ±2% °C
- Operating Voltage: 3V to 5.5V

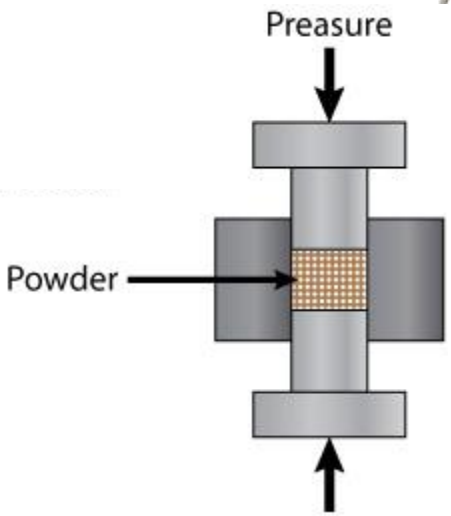


DHT11 Temperature and Humidity Sensor









INTERFACING DHT11 WITH NodeMcu

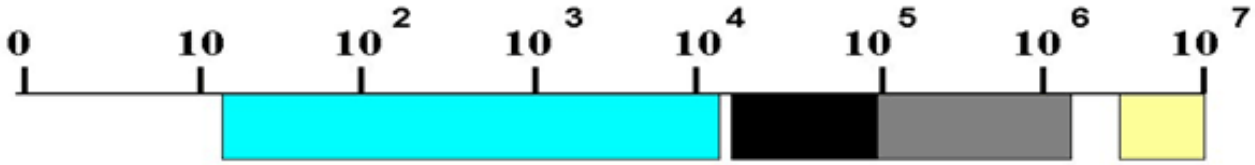
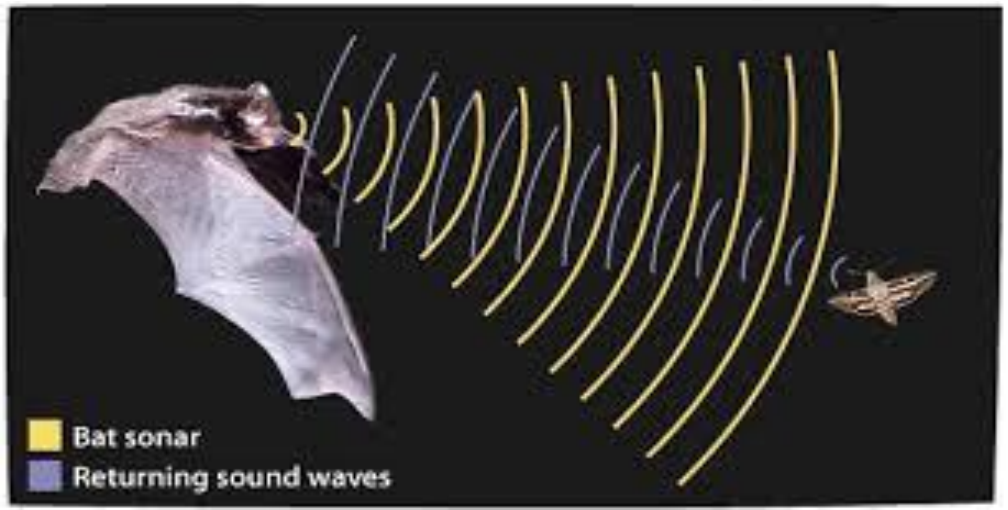
Ultrasonic

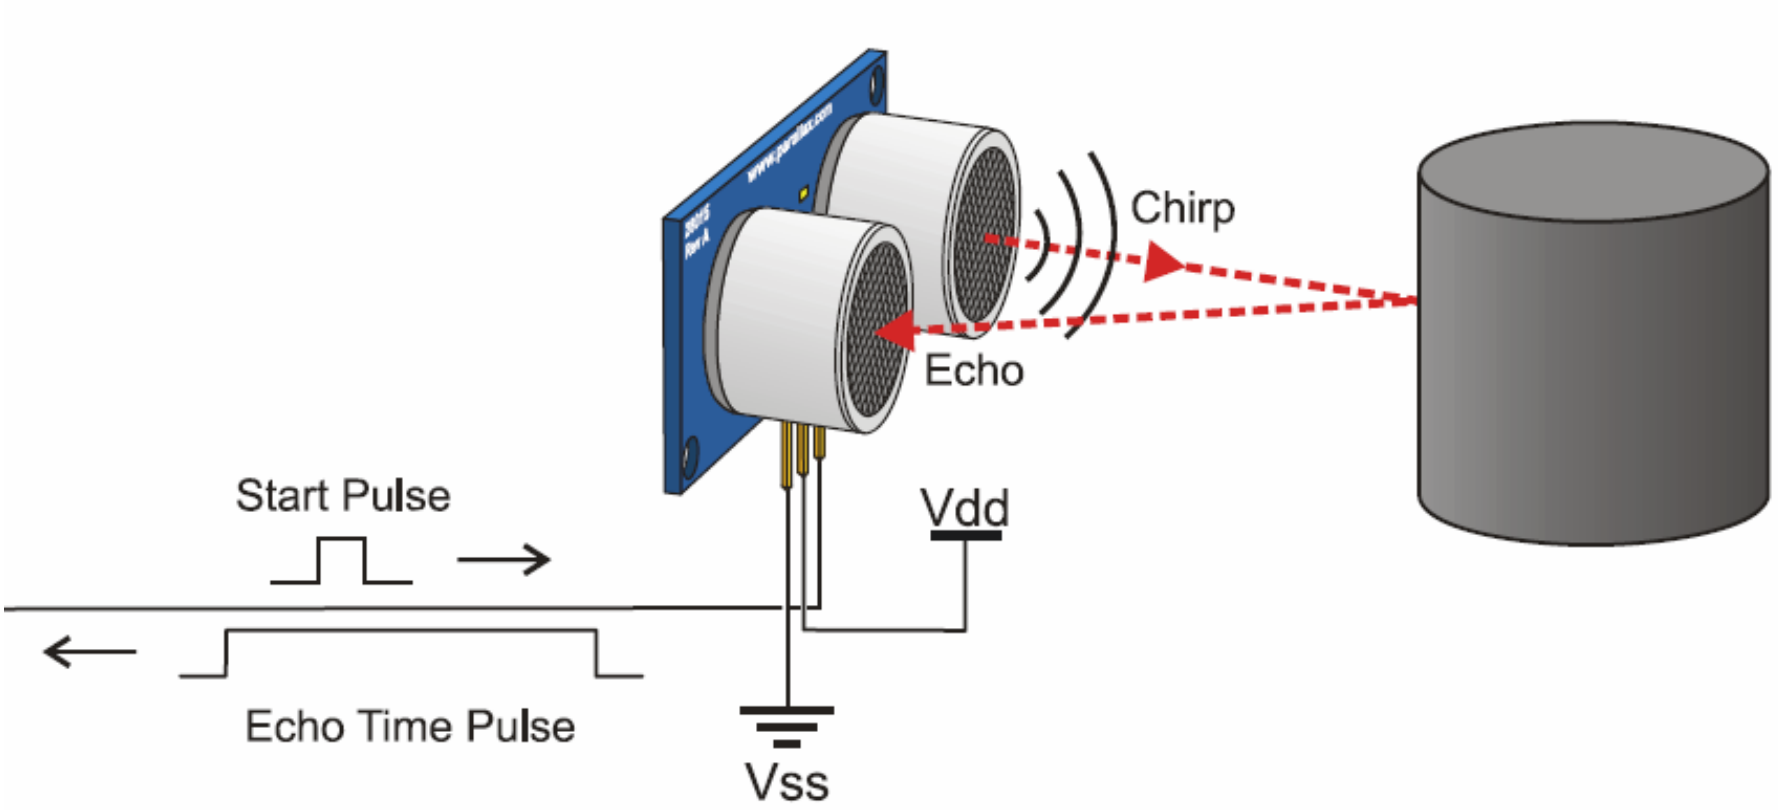
The Frequency Ranges of the Sound



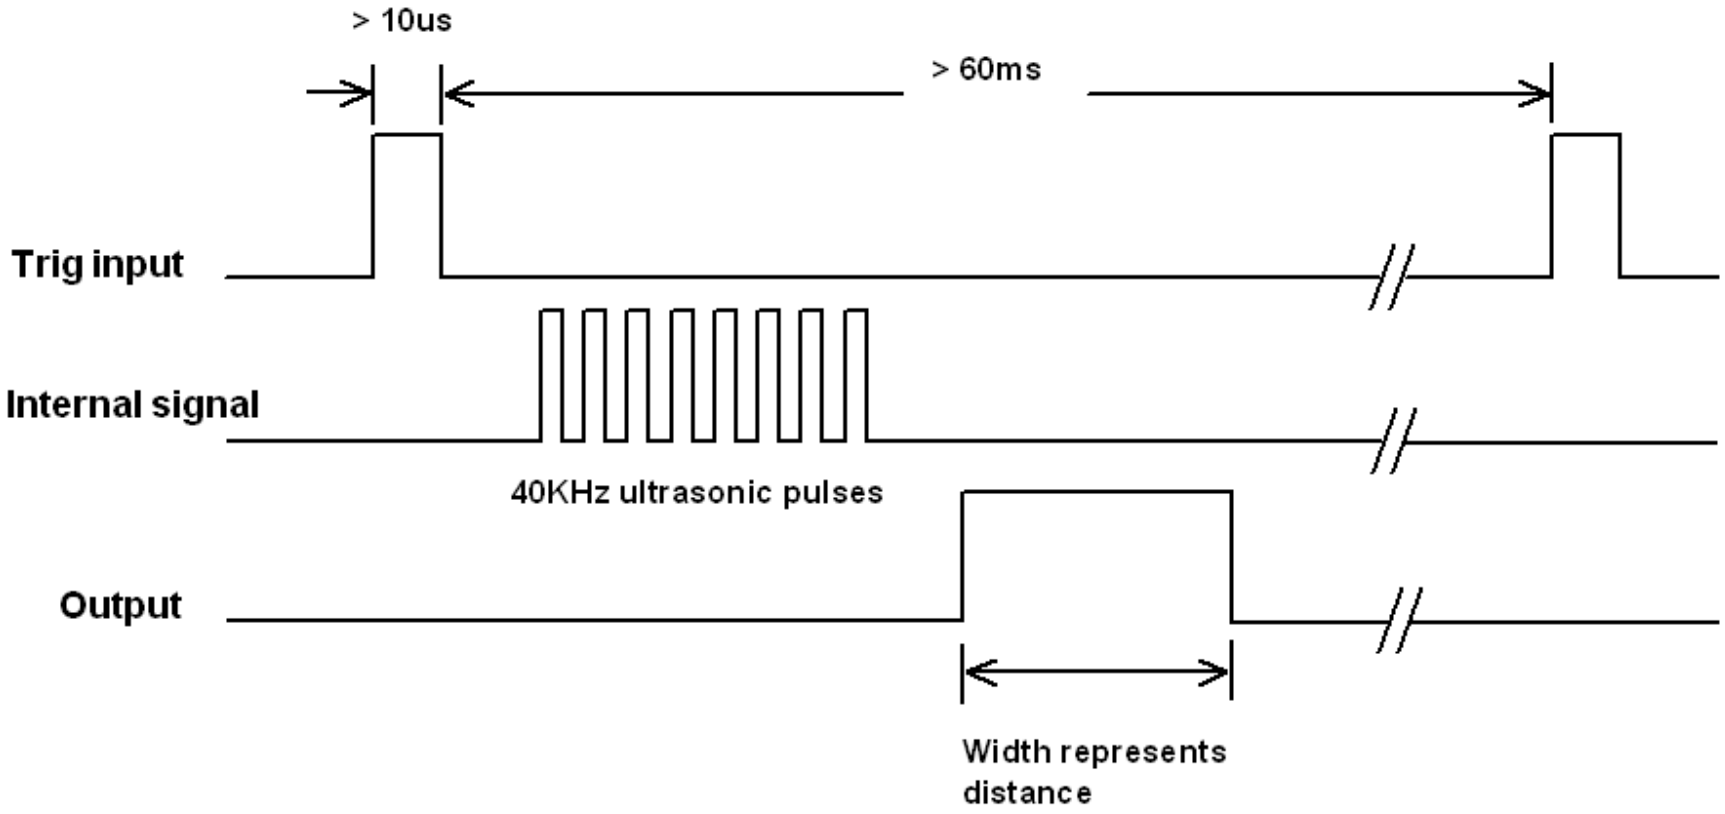
Human hearing		16Hz - 18kHz
Conventional power ultrasound		20kHz - 100kHz
Extended range for sonochemistry		20kHz - 2MHz
Diagnostic ultrasound		5MHz - 10MHz

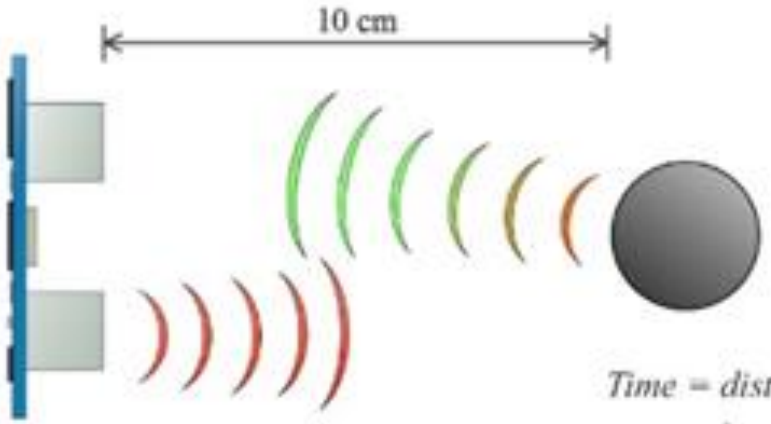


Working



Timing Diagram





speed of sound:

$v = 340\ m/s$

$v = 0{,}034\ cm/\mu s$

Time = distance / speed:

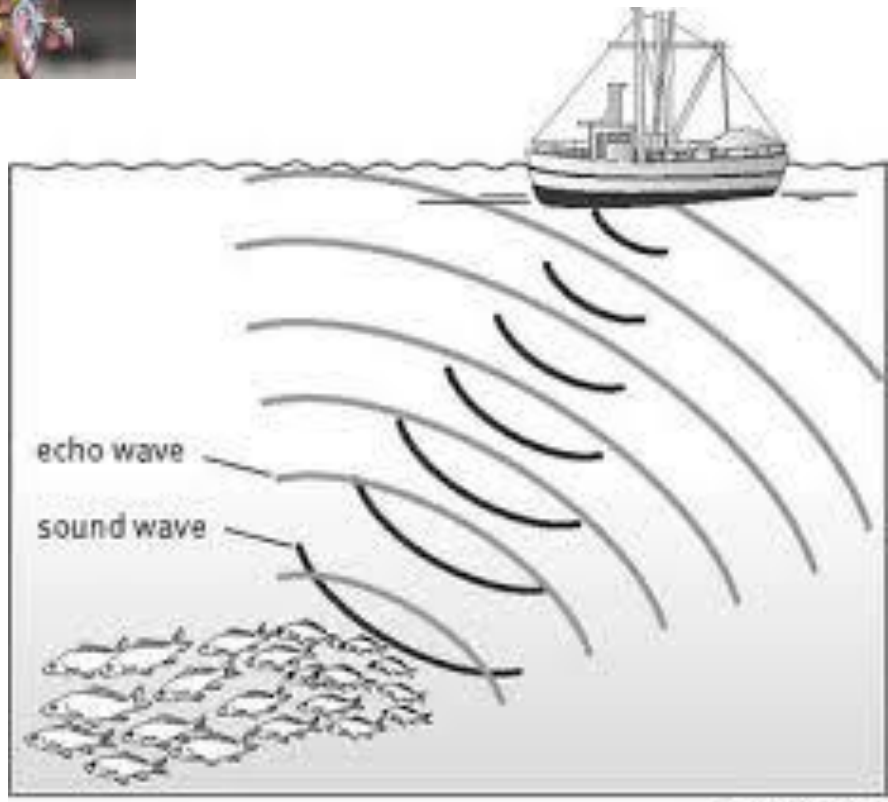
$t = s / v = 10 / 0{,}034 = 294\ \mu s$

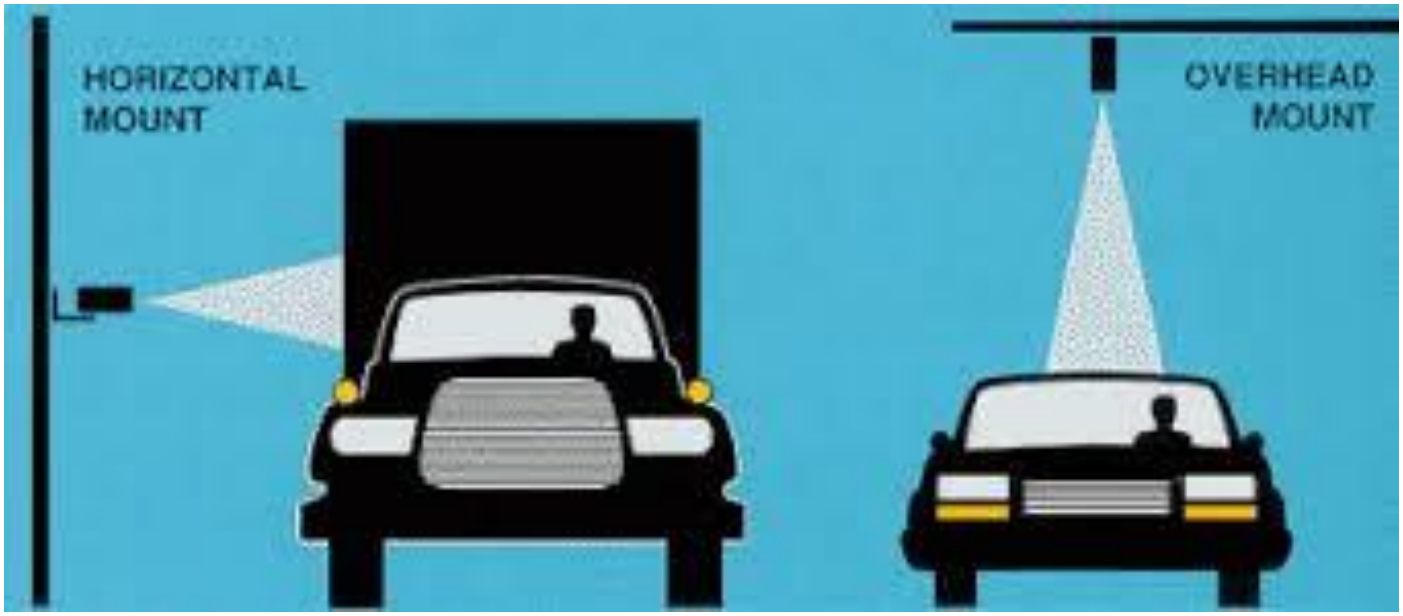
Distance:

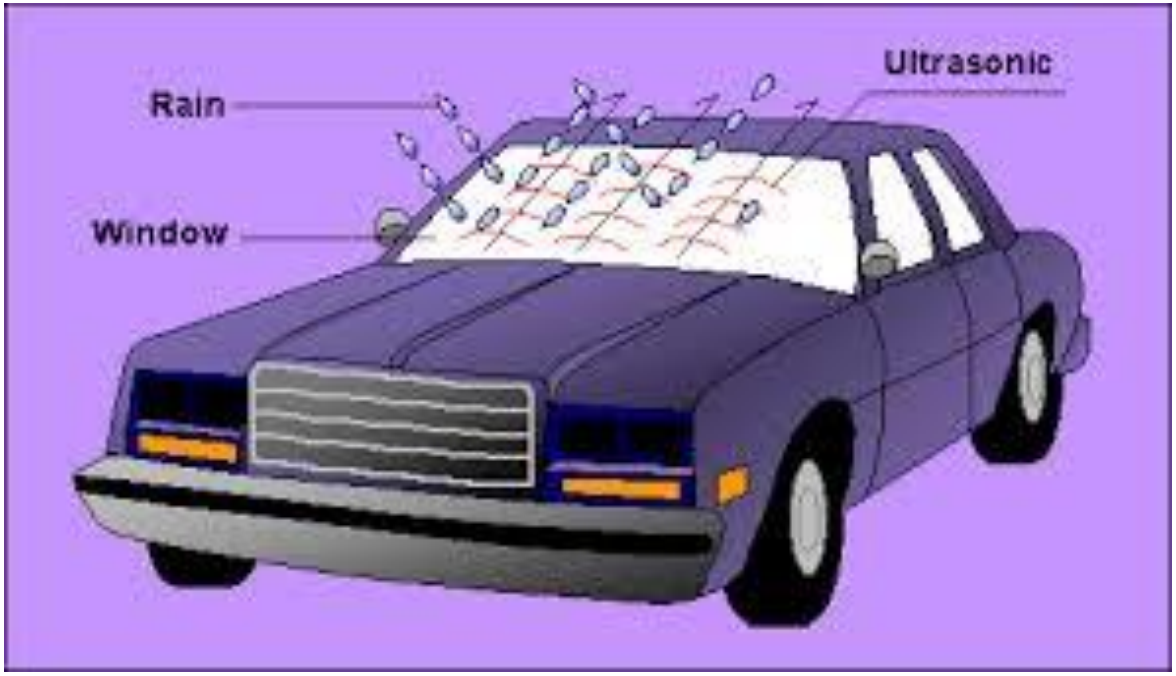
$s = t \cdot 0{,}034 / 2$

Applications

- Park assistance
- Distance measuring device
- SONAR
- Fishing



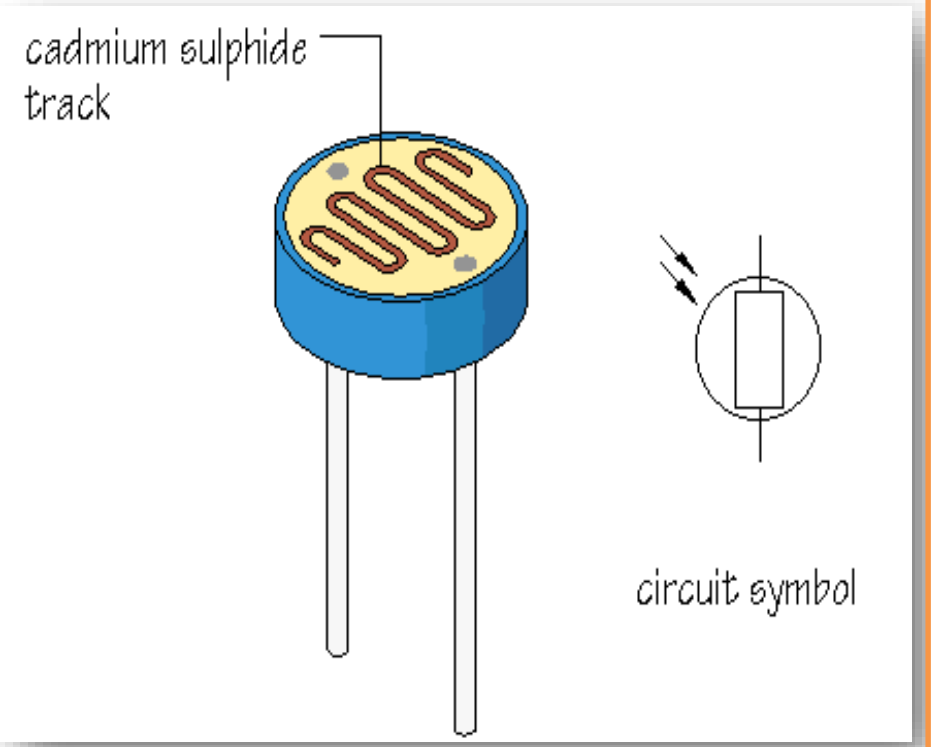




ARDUINO

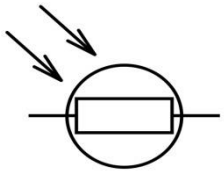
Light Sensor With NodeMcu

LDR(LIGHT DEPENDENT RESISTOR)



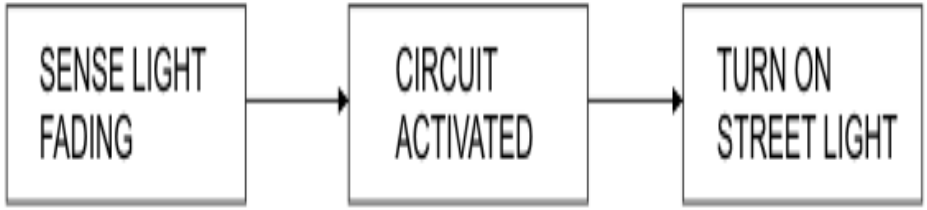
- **LDR stands for Light dependant resistor. An LDR is usually made of a semiconductor material(Normally Silicon) doped with a small percentage of a valence 5 material (commonly Arsenic), to make it an "N" material.**
- **Another word for LDR is photoresistor.**
- **The resistance of LDR decreases with increase in the intensity of light. An LDR works in the similar manner as any other analog device would work.**

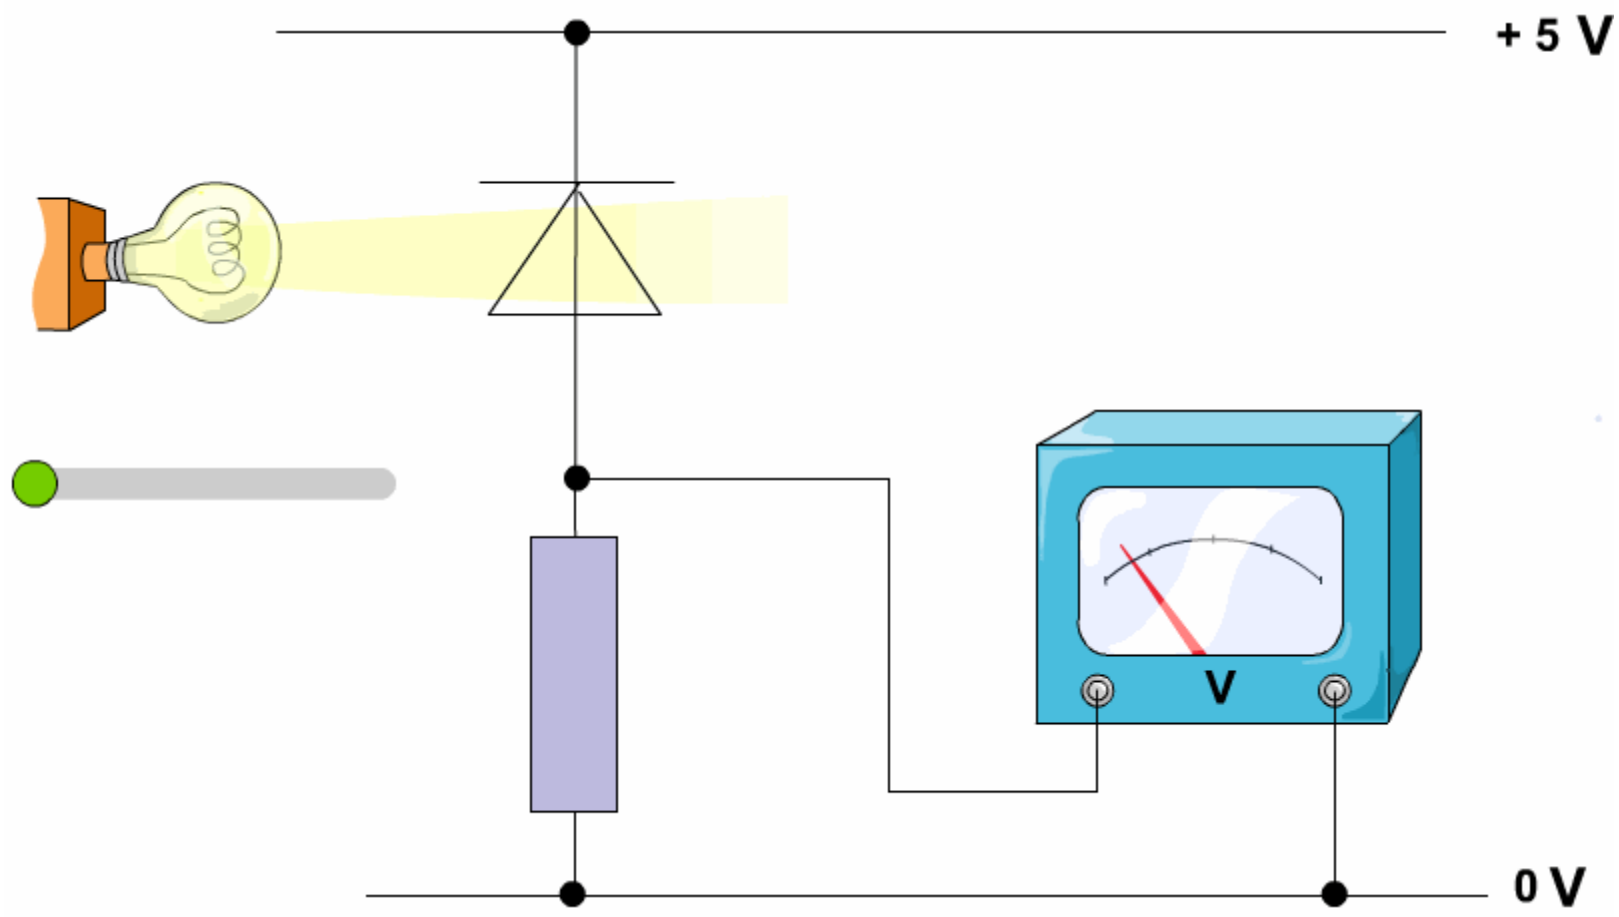
Symbol of LDR:



APPLICATIONS

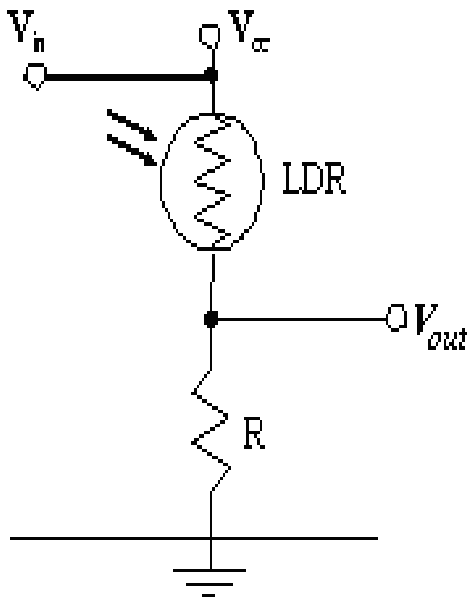
- **They can be used to respond to events such as the transition from daytime to night-time (and vice versa) for home automation**
- **Gardening applications, and are often used to control street lighting.**





+ 5 V
V
0 V

INTERFACING LDR WITH NodeMcu



Darkness -> LDR high -> Vout is low
Bright -> LDR low -> Vout is high
